Practice Test

English Language Arts

Grade 6

Student Name _____

Directions:

Today, you will take the Grade 6 English Language Arts Practice Test. If you do not know the answer to a question, skip it and go on to the next question. If you have time, go back to the questions you skipped and try to answer them before turning in your Student Test Booklet.

1. Read each passage and question. Then, follow the directions to answer each question.
2. Fill in the circle next to your answer choice or choices.
 - If you change your answer, make sure you erase your old answer completely.
 - Do not cross out or make any marks on the other choices.
3. One of the questions will ask you to write your answer.
 - Write your answer in the space provided in your Student Test Booklet.
 - Be sure to keep your answer within the provided space.

from *The Highest Tide: A Novel*

by Jim Lynch

The Highest Tide takes place in Puget Sound, which is located on the Pacific coast of Washington State.

- 1 I learned early on that if you tell people what you see at low tide they'll think you're exaggerating or lying when you're actually just explaining strange and wonderful things as clearly as you can. Most of the time I understated what I saw because I couldn't find words powerful enough, but that's the nature of marine life and the inland bays I grew up on. You'd have to be a scientist, a poet and a comedian to hope to describe it all accurately, and even then you'd often fall short. The truth is I sometimes lied about where or when I saw things, but take that little misdirection away and I saw everything I said I saw and more.
- 2 Most people realize the sea covers two thirds of the planet, but few take the time to understand even a gallon of it. Watch what happens when you try to explain something as basic as the tides, that the suction of the moon and the sun creates a bulge across the ocean that turns into a slow and sneaky yet massive wave that covers our salty beaches twice a day. People look at

you as if you're making it up as you go. Plus, tides aren't *news*. They don't crash like floods or exit like rivers. They operate beyond the fringe of most attention spans. Anyone can tell you where the sun is, but ask where the tides are, and only fishermen, oystermen and deep-keeled sailors will know without looking. I grew up hearing seemingly intelligent grown-ups say "what a beautiful lake," no matter how many times we politely educated them it was a *bay*, a briny backwater connected to the world's largest ocean. We'd point to charts that showed the Strait of Juan de Fuca inhaling the Pacific all the way down to our shallow, muddy bays at the southern end of Puget Sound. It still wouldn't stick. It was the same way with beach scavengers. There was no way to make them understand they were tromping across the roofs of clam condos. Most people don't want to invest a moment contemplating something like that unless they happen to stroll low tide alone at night with a flashlight and watch life bubble, skitter and spit in the shallows. . . .

- 3 I loaded up my kayak with a short shovel, a backpack and Ziploc sacks and paddled north out of Skookumchuck Bay around Penrose Point into Chatham Cove, a shallow, cedar-ringed half-circle of gravelly flats that sprawled before me like an enormous glistening disc. It was two-fifteen A.M., an hour before the lowest night tide of the summer with an albino moon so close and bright it seemed to give off heat. There was no wind, no voices, nothing but the occasional whir of wings, the squirts of clams and the faint hiss of retreating water draining through gravel. Mostly there were odors—the fishy composting reek of living, dead and dying kelp, sea lettuce, clams, crabs, sand dollars and starfish.
- 4 It was my first summer collecting marine specimens for money. I sold stars, snails, hermit crabs, and other tidal creatures to public aquariums. . . . Almost everything had a market, I was discovering, and collecting under a bright moon was when I often made my best haul, which worsened my insomnia and complicated my stories because I wasn't allowed on the flats after dusk. The other part of it was that you see *less* and *more* at night. You also see things that turn out not to be real.
- 5 I walked the glimmering edge, headlamp bouncing, picking my way to avoid crushing sand dollars and clam shells facing the sky like tiny satellite dishes. I saw a purple ochre star, then fifteen more strewn higher on the beach, their five legs similarly cocked, pinwheeling in slow motion back toward the water. None of them were striking or unusual enough to sell to the aquariums. They wanted head-turners and exotics. . . .

- 6 I rounded the oyster beds, to the far side, relieved to find it relatively crab free. It was low tide by then, and I saw the water hesitating at its apex,¹ neither leaving nor returning, patiently waiting for the gravitational gears to shift. Dozens of anxious clams started squirting in unison like they did whenever vibrating grains of sand warned them predators were approaching. I stopped and waited with them, to actually see the moment when the tide started returning with its invisible buffet of plankton for the clams, oysters, mussels and other filter feeders. It was right then, ankle deep in the Sound, feet numbing, eyes relaxed, that I saw the nudibranch.
- 7 In all my time on the flats I'd never seen one before. I'd read about them, sure. I'd handled them at aquariums but never in the wild, and I'd never even seen a photo of one this stunning.
- 8 It was just three inches long but with dozens of fluorescent, orange-tipped hornlike plumes jutting from the back of its see-through body that appeared to be lit from within.
- 9 Nudibranchs are often called the butterflies of the sea, but even that understates their dazzle. Almost everything else in the northern Pacific is dressed to blend with pale surroundings. Nudibranchs don't bother, in part because they taste so lousy they don't need camouflage to survive. But also, I decided right then, because their beauty is so startling it earns them a free pass, the same way everyday life brakes for peacocks

A nudibranch

¹apex: the highest point

1. Which sentence supports the idea that the narrator is a careful observer?
- Ⓐ "Most people realize the sea covers two thirds of the planet, but few take the time to understand even a gallon of it." (paragraph 2)
 - Ⓑ "People look at you as if you're making it up as you go." (paragraph 2)
 - Ⓒ "I rounded the oyster beds, to the far side, relieved to find it relatively crab free." (paragraph 6)
 - Ⓓ "It was low tide by then, and I saw the water hesitating at its apex, neither leaving nor returning, patiently waiting for the gravitational gears to shift." (paragraph 6)

2. This question has two parts. First, answer Part A. Then, answer Part B.

Part A

What is the narrator's point of view about most people's relationship with the ocean?

- Ⓐ He is critical of people who fail to accurately educate themselves about ocean life.
- Ⓑ He believes that people should spend more time enjoying nature than reading about it.
- Ⓒ He thinks that people should rely on personal experience rather than charts to explore nature.
- Ⓓ He is disappointed that so few people understand the work of fishermen, oystermen, and sailors.

Part B

Which detail from paragraph 2 shows how the author develops the narrator's point of view?

- Ⓐ "... few take the time to understand even a gallon of it."
- Ⓑ "Anyone can tell you where the sun is . . . "
- Ⓒ "... only fishermen, oystermen and deep-keeled sailors will know without looking."
- Ⓓ "We'd point to charts that showed the Strait of Juan de Fuca inhaling the Pacific . . ."

3. Which phrase shows that the narrator has a particular goal in searching the bay?
- Ⓐ "Most of the time I understated what I saw because I couldn't find words powerful enough" (paragraph 1)
 - Ⓑ "Almost everything had a market, I was discovering" (paragraph 4)
 - Ⓒ "I saw a purple ochre star, then fifteen more strewn higher on the beach" (paragraph 5)
 - Ⓓ "I stopped and waited with them, to actually see the moment when the tide started returning" (paragraph 6)
4. Select **two** ways in which paragraphs 3–5 help to develop the narrator's point of view.
- Ⓐ The description of the value of different animals shows the narrator's interest in making a profit.
 - Ⓑ The details about the beauty of the cove at night show the narrator's admiration for the scenery.
 - Ⓒ The list of materials that the narrator needs shows how hard he is willing to work for his discovery.
 - Ⓓ The focus on the stress that the narrator feels shows how much he needs to succeed in his search.
 - Ⓔ The number of animals that the narrator lists shows how much scientific research he thinks is needed.

5. How does paragraph 4 contribute to the reader's understanding of the passage?
- Ⓐ It describes which marine specimens are best for the narrator's market.
 - Ⓑ It provides background for the narrator's reason for being in Chatham Cove.
 - Ⓒ It describes the next event in the narrator's night to explain his research process.
 - Ⓓ It provides scientific information about tides in Chatham Cove to highlight the narrator's skill.

6. Read the sentence from paragraph 6.

"I stopped and waited with them, to actually see the moment when the tide started returning with its invisible buffet of plankton for the clams, oysters, mussels and other filter feeders."

What is the meaning of the word buffet as it is used in the sentence?

- Ⓐ hidden area
- Ⓑ rich nutrients
- Ⓒ strange shells
- Ⓓ plentiful supply

7. How is the narrator affected by his discovery of the nudibranch?
- Ⓐ His excitement upon finding a nudibranch causes him to calculate its worth.
 - Ⓑ His surprise at seeing a nudibranch in the wild interrupts his routine search.
 - Ⓒ His confusion about the nudibranch's position leads him to search for others.
 - Ⓓ His amazement at the nudibranch's colors distracts him from catching other creatures.

8. This question has two parts. First, answer Part A. Then, answer Part B.

Part A

What is a theme of the passage?

- Ⓐ acting courageously while on an adventure
- Ⓑ learning to accept the shortcomings of others
- Ⓒ feeling wonder about the treasures of the ocean
- Ⓓ understanding that humans and nature need each other

Part B

Which detail supports the theme in Part A?

- Ⓐ "You'd have to be a scientist, a poet and a comedian to hope to describe it all accurately, and even then you'd often fall short." (paragraph 1)
- Ⓑ "There was no way to make them understand they were tromping across the roofs of clam condos." (paragraph 2)
- Ⓒ "Most people don't want to invest a moment contemplating something like that unless they happen to stroll low tide alone at night with a flashlight . . ." (paragraph 2)
- Ⓓ "I loaded up my kayak with a short shovel, a backpack and Ziploc sacks and paddled north out of Skookumchuck Bay . . ." (paragraph 3)

Passage 1: Science Isn't Just for Scientists

by Silke Schmidt

- 1 On a sunny day, a yellow school bus heads to Elver Park in Madison, Wisc. The seventh graders inside are excited to launch the rockets they've built in class.
- 2 At the park, the students find their assigned flag posts, armed with their rocket, notebook, pencil and angle finder. Two at a time, they march to the launch pad and prepare their rocket for take-off. They wait for their teacher's signal to start the countdown: 5, 4, 3, 2, 1 . . . GO!
- 3 With the angle finder and a little math, they estimate each rocket's maximum height. They calculate how their rocket fared against 90 others made by their classmates and teacher.
- 4 "With the rocket unit, I teach the basic principles of physics and motion," explains David Ropa. He teaches science at Spring Harbor Middle School and embraces learning by doing. That includes taking math and science into the park.
- 5 "Kids, like all humans, are doing science all the time," says Ropa. They explore the world through play, he adds, whether it's stacking toys or building bike ramps. They have a hypothesis. They set up a test. They analyze the results. Then they adjust their strategy.
- 6 The tools his students use at school, says Ropa, are the same as those that many adults use at work. Some of these adults wear a white lab coat and carry a business card with the word "scientist." Most don't.
- 7 Chefs, musicians and gardeners often use the scientific method, though they may not call it that. Their jobs—and many more—apply textbook principles of science in the real world.

. . .

Role playing and role models

- 8 In Madison's Elver Park, the students make their rockets fly as high as they can. That teaches them the physics of flight. It also instills a sense of wonder and hopefulness, says Ropa.

. . .

- 9 Role models like [Ropa] can get and keep students interested in science, says Ryan Lei. He is a psychologist at Haverford College in Pennsylvania. His studies show that the language a teacher uses can also make a difference.
- 10 Kids stay more confident about “doing science” when their teachers use those words, Lei says. Talking about “being scientists” actually may lower their confidence. The kids in the studies ranged from preschool to late elementary school.
- 11 Attitudes toward science and scientists often change as kids mature, says Lei. So do the factors that shape those attitudes. Older students may care more about adult role models than a teacher’s language. But those adults don’t have to be scientists. They just need to model the human curiosity we’re all born with.
- 12 Says Hunter, “That’s what scientists really are—very curious people who keep that curiosity going in their jobs.”

Passage 2: 8-Year-Olds Publish Scientific Bee Study

by Lisa Grossman

- 13 A group of British schoolchildren may be the youngest scientists ever to have their work published in a peer-reviewed journal. In a new paper in *Biology Letters*, 25 8- to 10-year-old children from Blackawton Primary School report that buff-tailed bumblebees can learn to recognize nourishing flowers based on colors and patterns.
- 14 “We discovered that bumblebees can use a combination of colour and spatial relationships in deciding which colour of flower to forage from,” the students wrote in the paper’s abstract. “We also discovered that science is cool and fun because you get to do stuff that no one has ever done before.”
- 15 The paper itself is well worth reading. It’s written entirely in the kids’ voices, complete with sound effects (part of the Methods section is subtitled, “‘the puzzle’ . . . duh duh duuuhhh”) and figures drawn by hand in colored pencil.

- 16 The project, which began three years ago, grew out of a lecture neuroscientist Beau Lotto of University College London gave at the school, where his son Misha was a student. Lotto spoke about his research on human perception, bumblebees and robots, and then shared his ideas on how science is done: "Science is nothing more than a game."
- 17 "Nature's way for us to discover patterns and relationships is to play. That's the same aim that science has," Lotto said. "I think everyone does science every day. The scientific process is part of life."
- 18 After the talk, Lotto and Dave Strudwick, Blackawton Primary School's head teacher, decided to try to do an original research project with the students where the kids would have full control. . . . "It's so different from other science-education programs, where the aim is to learn facts," Lotto said.
- 19 Over the course of about two months, Strudwick and Lotto got the kids thinking about what questions interested them, and how they could solve those questions through puzzles or games. Eventually they focused their questions on bumblebees.
- 20 "If you want to ask a question of a bumblebee, you have to put yourself in the perspective of bumblebees," Lotto said. "So we had a day of being bumblebees."
- . . .
- 21 Misha Lotto, now 10, says his view of science changed thanks to the bees.
- 22 "I thought science was just like math, really boring," he said. "But now I see that it's actually quite fun. When you're curious, you can just make up your own experiment, so you can answer the question."
- 23 Some of the students now want to be scientists when they grow up, but some still want to be soccer players and rock stars. That's okay, Lotto says.
- 24 "If they don't turn out to be scientists, that's not a big deal," he said. "The hope is that this kind of program doesn't just create data and information and little scientists. Being uncomfortable with uncertainty, in fact being excited about not knowing—that's really what we're trying to foster through science."

9. How do paragraphs 1–3 introduce the ideas of Passage 1?
- Ⓐ by listing the steps taken to test the students' rockets
 - Ⓑ by describing the weather's effect on the rocket experiment
 - Ⓒ by comparing the rocket experiment to other outdoor activities
 - Ⓓ by contrasting the materials used by students to build their rockets

10. Read the sentences from Passage 1.

"They set up a test. They analyze the results. Then they adjust their strategy." (paragraph 5)

What is the meaning of the word analyze as it is used in the sentences?

- Ⓐ study
- Ⓑ recite
- Ⓒ work hard on
- Ⓓ try to change

- 11.** How do the quotations from Ryan Lei in paragraphs 9–11 support the author’s central claim in Passage 1?
- Ⓐ They provide evidence for why students enjoy having class in the park.
 - Ⓑ They reveal a different point of view on why science classes can be unpopular.
 - Ⓒ They give reasons why students can be scientists if they are willing to work hard enough.
 - Ⓓ They support the idea that science should be presented to students in a more approachable way.
- 12.** How does the author support the claim that the bee study in Passage 2 benefited the students who participated? Select **two**.
- Ⓐ by pointing out how experiments will help students in careers outside science
 - Ⓑ by quoting a student whose opinion about science changed after the experiment
 - Ⓒ by mentioning similar projects in the past that led students to become scientists
 - Ⓓ by describing challenges the students overcame when planning their experiment
 - Ⓔ by referring to a comment about how interesting the experiment was for the students

- 13.** How do paragraphs 14 and 15 add to the structure of Passage 2?
- Ⓐ by comparing the student research to similar scientific conclusions
 - Ⓑ by listing some ways that students were a major part of the experiment
 - Ⓒ by listing the types of data the students used to make their conclusions
 - Ⓓ by comparing the steps the students followed to complete their experiment
- 14.** Which sentence from Passage 2 supports the inference that learning about nature can be done through creative thinking?
- Ⓐ ““We discovered that bumblebees can use a combination of colour and spatial relationships in deciding which colour of flower to forage from,” the students wrote in the paper’s abstract.” (paragraph 14)
 - Ⓑ “Eventually they focused their questions on bumblebees.” (paragraph 19)
 - Ⓒ ““If you want to ask a question of a bumblebee, you have to put yourself in the perspective of bumblebees,” Lotto said.” (paragraph 20)
 - Ⓓ “Misha Lotto, now 10, says his view of science changed thanks to the bees.” (paragraph 21)
- 15.** How do Passage 1 and Passage 2 focus on scientific education in the same way?
- Ⓐ by encouraging students to focus on scientific writing
 - Ⓑ by describing ways to guide students toward scientific careers
 - Ⓒ by explaining different ways to get students interested in science
 - Ⓓ by emphasizing how spending more time outdoors inspires students

Writing**Directions:**

Read the writing prompt and sources. Then write your final essay on pages 24 through 26. Check over your essay when you are finished.

Writing Prompt

Your art teacher has asked that you write a paper about a specific kind of art. Write an explanatory essay about art created from found or recycled items. Your essay must be based on ideas and information that can be found in the sources.

Manage your time carefully so that you can

- read the sources;
- plan your response;
- write your response; and
- revise and edit your response.

Be sure to

- use evidence from multiple sources; and
- avoid overly relying on one source.

Your response should be in the form of a multiparagraph essay. Write your response in the space provided.

Art from Found Items

Source 1: Used Materials, New Art

by Thomas R. Miller

- 1 Art can be made out of anything, including ordinary things we find around us. Everyday objects that we usually throw away, such as metal cans or bits of newspaper, can be reused to make sculpture, jewelry, or musical instruments, for example. Their value depends on the artist's ability to see how their shape, color, material, or design can be used in a new way. Some artists even recycle images and materials from other people's art, adding personal touches or altering the original artwork to make their own statement.
- 2 A patchwork quilt is sewn together from scraps, remnants, and rags. Quilters, often working together, combine these irregular bits and pieces of cloth into a new pattern. In rural America, the traditional quilting bee gave friends and neighbors a chance to get together and exchange news and gossip.
- 3 Public places can become art spaces. Artists on New York's Lower East Side have transformed an old gas station into a gallery, sculpture garden, and performance space. They turn abandoned cars and other urban debris into a community work of art that continues to grow. . . .
- 4 The German artist Kurt Schwitters (1887–1948) used discarded objects to create a style of art he called Rubbish. Schwitters walked the streets collecting torn pieces of paper, ticket stubs, and bits of string—anything someone had thrown away—and used glue to combine them on a plain background. That kind of picture is called a collage, from the French word for paste. . . .
- 5 With a little imagination, any object can be used for art. During World War II, raw materials of all kinds were in short supply. The famous Spanish artist Pablo Picasso (1881–1973) hoarded "junk" such as bicycle frames, mattress springs, and gardening tools, which he made into sculptures. *Bull's Head*, created in 1942, is made from a bicycle seat and handlebars cast in bronze.

- 6 Musical instruments can be made from recyclables. American composer Harry Partch (1901–1974) turned large glass bottles called carboys into an enormous set of hanging gongs. Partch named his instrument the Cloud-Chamber Bowls in 1950, when he found the tops and bottoms of carboys that had been cut in a laboratory Doing some experimenting of his own, he discovered ways of striking the bowls to produce beautiful and complex tones.

Source 2: Andy Goldsworthy —Sculpting Earth Art

by Kathryn Hulick

- 7 Have you ever stacked stones in a huge pile or built a fort out of sticks? Then you’re an Earth Artist. You don’t need paint or paper to make art: in fact, Earth Artist Andy Goldsworthy started out with a simple rule: he would work outside and only use materials he could find nearby. That meant using thorns to pin dried stalks together and spit to paste leaves to rocks! “I splashed in water, covered myself in mud, went barefoot, and woke with the dawn,” Goldsworthy says in the book *Hand to Earth*. He also got rained and snowed on a lot, sometimes on purpose! To make a “rain shadow,” Goldsworthy lies down on the ground when it’s just beginning to rain, then gets up once he’s soaked and takes a picture of the manshaped dry spot he left behind.
- 8 Home is in Scotland, but Goldsworthy has worked in the United States, France, Australia, Japan, and even at the North Pole. His finished works made of stones, sticks, leaves, ice, sand, or mud look astoundingly simple and beautiful, but the process can be filthy and even frustrating. The purpose isn’t just to make a nice piece of art—it’s a way of learning about the world. In his book *A Collaboration with Nature*, Goldsworthy says, “I stop at a place or pick up a material because I feel there is something to be discovered. Here is where I can learn.”

Gluings Icicles

- 9 A man with white hair, a white beard, and a Scottish accent rubs his freezing hands together before picking up a piece of icicle, dipping it in snow and then in water, and holding it against another bit of ice. Then he waits patiently until the two pieces freeze together.

- 10 Andy Goldsworthy is being filmed in action for the documentary *Rivers and Tides*. The curving line of ice he's working on looks as if it weaves through and around a point of stone. If a piece of icicle doesn't fit quite right, he chews the end until it does. His hands are cold and dirty, but he can't feel the ice properly with gloves on. "It's hard going and it's hard on the hands. . . . All effort is going into trying to make something that is effortless," he says.
- 11 Finally, the Sun rises and shines through the curving ice; it seems to glow. "I never had any idea that would happen!" Goldsworthy says with delight, going on to point out that "the very thing that brings the work to life is the thing that will cause its death." The ice will melt in the sunlight, and the sculpture will be gone.

Balancing Stones

- 12 Most of Goldsworthy's work isn't meant to last, and some of it falls apart before it's even finished! In *Rivers and Tides*, the artist tries to construct an egg-shaped cairn¹ on the beach out of flat stones. Although it looks sturdy, the growing pile of stone is a delicate act of weight and balance. Suddenly, the whole thing collapses! Goldsworthy hangs his head for a minute before cleaning up and starting over. Four times, the cairn falls over. "Each time I got to know the stone a little bit more," says the artist. "It got higher each time. It grew in proportion to my understanding of the stone. I obviously don't understand it well enough—yet!" The old reminder to learn from your mistakes is certainly true when it comes to Earth Art!

¹cairn: a mound of stones made as a marker or memorial

Thinking BIG and Little

- 13 Goldsworthy doesn't always work alone or in the middle of nowhere. He's worked in busy city parks, carted snowballs into the middle of Glasgow, Scotland, in the summer to watch them melt, and employed expert builders to help create huge installation pieces² like a 2,278-foot-long winding stone wall at the Storm King Art Center in New York state. But his fascination with small and delicate parts of nature never fades. According to Goldsworthy, creating a box out of leaves can be an even more monumental task than building a gigantic earthwork.

²installation pieces: artworks displayed in a large area as arranged by the artist
